Preface

This standard outlines the approved construction processes and detailed standard arrangements for Public Lighting within the TasNetworks electrical network. It provides guidance on best practices to ensure compliance with TasNetworks' design and installation requirements.

To accommodate design improvements and technological advancements, this standard is periodically updated. Users are responsible for ensuring they refer to and implement the latest version of TasNetworks' standards in all public lighting projects.

Scope

The Public Lighting Construction Standard applies to all unmetered public lighting installations within the TasNetworks network. Metered lighting installations are not covered under this standard.

The requirements specified in this construction standard apply primarily to greenfield sites and should be adhered to for brownfield sites wherever feasible.

Any deviations or non-compliances must receive prior approval from the TasNetworks Design, Standards (AMSS), and Asset Management Team before implementation.

Change Process for this Standard

TasNetworks reviews and updates lighting standards periodically, with a minimum review cycle of 36 months to ensure alignment with current industry practices and regulatory requirements.

All change requests related to the Public Lighting Construction Standard must be submitted to the Asset Management Team, where they will be recorded in the change management register.

Change requests will be categorised based on priority as follows:

- Immediate consideration (critical updates requiring urgent implementation).
- Lower-priority changes (scheduled for inclusion in the next planned review cycle).

Depending on the urgency and impact of the proposed changes, TasNetworks will assess, endorse, and communicate the updates to all relevant stakeholders before implementing them in the standard.

Obsolete Materials

This part of Standard contains drawings that are no longer part of the current Public Lighting Construction Standard and are provided strictly for reference purposes.

These drawings must not be used for new installations. Their inclusion in this document is solely to support the review of legacy installations and assist in identifying superseded construction details.

All designers and installers must ensure that only current, approved materials and drawings which are given in first part are used in active projects. It remains the responsibility of the user to verify that they are referencing the most up-to-date versions of TasNetworks' standards and drawings.

Definitions

Aero screen luminaire	A luminaire that has a flat diffuser recessed or finished flush with the body of the unit. Also called 'full cut-off luminaires' describing luminaires that emit no light above the horizontal plane.
Blowout	The horizontal deviation from centre of power line conductors when subjected to lateral wind forces.
Conduit (Also 'Duct')	A pipe or closed passage formed underground or in a structure and intended to receive one or more cables that may be drawn through it.
Control Gear	The equipment required within the luminaire for starting and running the lamp. Control Gear includes the ballast or choke, capacitor, photo-electric control switch, igniters or starting device if required, lamp holder and wiring.
Frangible column	A lighting column designed to fail on vehicle impact in a controlled manner. The two frangible column types are slip-base and impact absorbing; TasNetworks use the latter.
Impact absorbing column	A column designed to deform around a vehicle upon impact and gradually slow the vehicle.
Lamp	The generic term for the light source in a luminaire.
LED	Light Emitting Diode – (a semiconductor diode which glows when a voltage is applied).
Lighting column	A vertical structure of any appropriate material, which, is designed to support luminaires either directly or by use of outreach arms or mounting frames.
Luminaire	A lantern; the entire apparatus which distributes, filters, or transforms the light transmitted from one or more lamps and which includes, all the parts necessary for fixing and protecting the lamps and connecting them to the electrical supply.
Mounting height	The vertical distance between the photometric centre of a luminaire and the surface which is to be illuminated.
Outreach	The distance, measured horizontally, from the photometric centre of a luminaire to: <ol style="list-style-type: none"> For lighting columns with outreach arms, the centre of the vertical section of the pole For bracket arms, the mounting plate which the bracket arm is secured to the pole, wall or other surface.
Sinking depth	The depth of a column below ground level.
Upcast or Tilt Angle	The angle by which the axis of the fixing spigot entry is tilted above the horizontal when the luminaire is installed.
Works plan or 'construction drawing'	An instruction in the form of a drawing or plan detailing the construction requirements to carry out nominated capital or maintenance works on the electricity distribution system.
Major Road Lighting Cat - V	Major road lighting, as defined in the AS 1158 series, is designed to provide high levels of illumination for roads with significant traffic volumes and higher-speed limits, ensuring safety and visibility for drivers and pedestrians in complex traffic environments.
Minor Road Lighting Cat - P	Minor road lighting refers to illumination for roads with lower traffic volumes and slower speed limits, such as residential streets or local roads, aimed at providing sufficient visibility for safety and general access.
Decorative Lighting	Decorative lighting focuses on enhancing the aesthetic appeal of urban spaces, parks, and streetscapes while meeting functional lighting requirements, often featuring architecturally styled luminaires or poles.
